

Spirometry Reference Chart

This flowchart follows The American Thoracic Society Example For Interpretation.

Typical Spirograms ranging from normal limits to severe restriction.

Typical Spirogram curve for normal, obstruction and restriction patterns

For your protection, all of Welch Allyn Spirometers use disposable flow transducers that minimize the risk of cross contamination.

Normal Spirometry

Note the sharp initial peak flow, then relatively straight descent at about 45 degrees to the baseline. All of the parameters are within normal limits.

Mild Obstruction

The FEV1/FVC% predicted is abnormal (79%), indicating obstruction. The severity of the obstruction is mild as judged by the FEV1, which is 62% of the predicted. Mild obstruction occurs gradually over many years.

Moderate Obstruction

The FEV1/FVC% predicted is abnormal, indicating obstruction. The FEV1 % predictive is 63% indicating the obstruction is moderate in severity. Note the concave shape of the flow volume curve with low flows after the initial sharp peak flow.

Severe Obstruction

Severe obstruction with a low vital capacity. All of the parameters are abnormally low. The low FEV1/FVC% indicates obstruction, and the FEV1 of only 28% of normals shows that the obstruction is severe. A superimposed restriction may also be present since the FVC is abnormally low (46%).

Severe Restriction

FEV1/FVC% prediction of 101% is normal, so obstruction does not exist. The FVC however is only 41% of normal, indicating severe restriction. FEV1 is also decreased 44% but to a lesser degree than the FVC in restrictive disorders. Note the sharp peak and rapid, straight, and steep decline of the flow volume curve.
