\*For children under nine years old IN CLINICAL RISK GROUPS, give 1 dose if child has been immunised with flu-containing vaccine before. If never immunised with flu-containing vaccine, give 2 doses four weeks apart.

\*\*Fluenz is administered by the intranasal route and is supplied in an applicator that allows a divided dose to be administered in both nostrils. The device allows intranasal vaccination to be performed without the need for additional training. *Neither divided dose needs to be repeated if the patient sneezes, or blows their nose following administration.* The live attenuated vaccine can be given at the same time as other vaccines including live vaccines.

\*\*\*All the Fluenz will have expired by 16th January 2014. In the light of this it will be important to ensure that efforts are made to vaccinate children before the Christmas holidays.
